

KINVET OvuMax

“Vigorous Males, Vibrant Chicks, Valued Profits.”

How to Use KINVET OvuMax

Daily Dose for Breeder Males

- Apply 50–75 g of KINVET OvuMax per 100 male birds for 21 days
- This ensures steady support for sperm production without overloading the birds.

When to Give an Extra Boost

- If you notice lower mating activity, reduced semen volume, or weak chicks, repeat the 21-day course.
 - For persistent issues, consult your vet or nutritionist to tailor the program.
-

Farmhand Favorites: Do's

1. Store It Right

- Keep the bag **sealed** in a **cool, dry place**—moisture robs its potency.

2. Blend Thoroughly

- Sprinkle KINVET OvuMax **slowly** into feed so every bird gets an even share.

3. Monitor Your Roosters

- Check **mating behavior**, **semen volume**, and **chick hatch rates** daily.

4. Keep the Coop Clean

- Remove wet bedding and wipe down drinkers to cut mold and infection risks.

5. Pair with Good Nutrition

- A balanced supplement like **KVS-ActiGrow** helps adaptogens and probiotics work their best.
-

Farmer's Don'ts – Avoid These Mistakes:

1. Don't Overdo It

- More product won't speed results; it only wastes powder. Stick to 50–75 g/100 birds unless your vet advises otherwise.

2. **Don't Leave Bag Open**

- Air and humidity degrade the botanicals. Keep it sealed/closed tight.

3. **Don't Neglect Feed Quality**

- KINVET OvuMax boosts reproductive health but can't fix moldy or stale feed. Rotate and store the feed properly.

4. **Don't Skip Hygiene**

- Dirty coops, feeders, or drinkers stress birds and undermine fertility. Clean daily.

5. **Don't Forget Biosecurity**

- Use footbaths, limit visitors, and wash boots between houses. Reducing disease pressure helps KINVET OvuMax shine.

Pro Tip

“Just add a dash of KINVET OvuMax to their daily feed, and you'll see your breeder roosters walking tall and delivering peak fertility—totally natural, no chemicals involved.”
